COMMERCIAL APPLES

Production by Varieties
1967 With Comparisons

U. S. DEPT. OF AGRICULTURE
NATIONAL AGRICULTURAL LIBRARY

December 1, 1967

MAY 13 1968

Commercial apple production in the United States during 1967 totaled 5,462 million pounds, 5 percent less than the 1966 crop and 8 percent less than average.

In the Eastern States, soil moisture was improved compared with 1966, but set varied from good to poor because of unfavorable pollination conditions. The 1967 crop totaled 2,576 million pounds, 18 percent above last year but 7 percent less than average. Production in the Central States in 1967 totaled 953 million pounds, 13 percent less than 1966 and 20 percent less than average. The small crop was due to severe winter weather and poor pollination conditions last spring, particularly in the North Central States. In the Western States, 1967 apple production totaled 1,933 million pounds, 22 percent less than in 1966 and 2 percent less than average. Smaller crops in California and Washington are primarily responsible for the reduced production in the Western area.

Washington is the leading State with a 1967 crop of 1,300 million pounds, accounting for nearly one-fourth of the Nation's apple production. New York ranks second with 935 million pounds, and Michigan third with 525 million pounds. California's 384 million pound crop places that State in fourth position, followed by Virginia and Pennsylvania in fifth and sixth, respectively.

Red Delicious is the leading variety, with 27 percent of the 1967 production. Over half the Delicious crop was produced in Washington. The second most important variety is McIntosh representing 12 percent of total production. New York produced 45 percent of the McIntosh crop and New England 32 percent.

Golden Delicious is a close third with almost 12 percent of total production. Other leading varieties and percent of total production are: Rome Beauty, 8 percent; Jonathan, 6 percent; and York Imperial, 5 percent. Winesap lost its sixth place position to York Imperial because of a considerably below average crop of Winesap in Washington while the York crop in Virginia and West Virginia was only moderately below average. The six most important varieties account for 70 percent of the U. S. crop.

Ninety percent of this year's crop was winter varieties, 3 percent more than in 1966. Fall varieties accounted for 8 percent of this year's crop and 9 percent of the 1966 crop. Summer varieties made up 2 percent of 1967 production compared with 4 percent in 1966.
